

Mainline:

Helping you achieve the right security solution

Identify risks before a crisis happens

Mainline offers penetration testing. The objective of a penetration test is to investigate your system from the attacker's perspective. The primary goal is to identify exposures and risks before seeking a solution. Penetration testing is a live test of the security defenses of a network, conducted remotely over the Internet. Mainline's team of security specialists use techniques and exploits that real-life hackers would use to simulate the result of an attack. Penetration testing helps an organization determine its level of network security and vulnerability, and identify weak elements that need to be repaired. It can aid in evaluating an organization's detection and response capabilities as well as help determine whether the proper controls are in place.

Protect your assets

Whether an external intrusion or an internal breach, the results can be devastating to your business. A multi-layered security solution that covers all your bases can detect any weaknesses and keep threats out of your environment. The multiple layers ensure that all entry and exit points of your organization are monitored and protected. Mainline's team of security specialists can assess your risks and offer a protection plan that fits your needs.

Meet compliance standards

While protecting your assets is a sound business practice, it is often a requirement mandated by the government. Mainline offers industry leading solutions that can help you meet compliance standards including those mandated by HIPAA, PCI, Gramm-Leach-Bliley, Sarbanes-Oxley, SCADA, FFIEC, FISMA and others. We can conduct assessments that make sure your organization is in compliance and can produce the necessary compliance reporting documentation.

When you select an Information Security solution, you want a lasting partnership. Mainline Information Systems is a \$700 million-per-year national corporation that has a business history stretching back two decades.

Offering the right expertise

The combined experience of Mainline's Information Security team spans over 100 years, and reflects expertise in all segments of the security industry. Our expertise ranges from experienced security sales consultants to security-certified technical engineers. In addition, Mainline ensures that the experience of its Information Security team is backed by independent assessments and certifications.

By applying expertise in security, networking, operating environments and storage technologies, as well as our unique skills in consulting, integration and managed services, we are able to create customized security solutions for our clients.

We work with clients that include many of America's largest organizations and government agencies, and we provide services to major clients throughout Mexico and Puerto Rico.

Information Security Solutions

Solutions from Mainline for ALL of Your Security Needs

Security is about managing risks and reducing threats. Organizations today are most concerned about threats to confidentiality, availability and integrity.

In addition, internal threats such as employee access issues, administrator privileges and password misuse are on the top of the list. And, the threats are changing all the time, which makes keeping up with the threats a full-time job. Traditional security measures such as firewalls and anti-virus do not stop today's sophisticated attacks and threats. The number and complexity of information security attacks are growing every day. Security best practices, auditor requirements and compliance regulations mandate that organizations take additional steps to have more security defenses, policies and procedures.

security solutions group

Are your assets really protected?

Mainline Information Systems™ is one of the few solution providers that can provide an end-to-end, layered security solution – one that protects your assets from threats of all sizes and shapes. The Mainline team can assess your current environment and determine what kind of solution is most appropriate for your organization.

Mainline's Security Solutions help customers:

- › Develop a strategic plan that leverages multi-layered, preemptive security technologies
- › Reduce risks
- › Achieve regulatory compliance
- › Maintain business continuity and reach their security goals
- › Upgrade and protect their network environments to include best-of-breed security

Mainline - Your Information Security Partner

- › Best-of-breed solutions
- › Highly skilled and certified security practitioners
- › Trusted security advisor and partner
- › Sales and technical resources throughout the United States
- › Award-winning company

The Mainline approach to information security

Mainline's Information Security solution offerings address security issues through a comprehensive portfolio of products (appliances and software), professional security services and managed security services. Combined, these solutions help customers address their security issues and protect their investments for the future.

Mainline Security Portfolio

Intrusion Detection/Prevention

- Network and host-based systems to inspect and block malicious traffic before they impact your environment

Network Anomaly Detection

- Behavior analysis solutions that audit network flow data from existing infrastructure devices and alert you to out-of-the-ordinary activity

Server and Desktop Protection

- Systems and software to automatically protect desktops, laptops and servers against known and unknown threats

Vulnerability Management

- Integrated vulnerability protection and administration for managing vulnerabilities and protecting services

Email Security

- Solutions for email security and filtering offering multi-layer anti-virus, multi-layer anti-spam and fraud protection

Web Content Filtering

- Solutions offering real-time Web content filtering, combined with robust management and reporting tools, providing complete visibility into threat-related activity

Unified Threat Management

- Multi-function, all-in-one appliances that include intrusion prevention, firewall, VPN, anti-virus/anti-spam and Web filtering

Web Application Security

- Systems to scan and test for Web application vulnerabilities and to provide real-time, behavior-based security through advanced Web application firewalls

Data Protection/Encryption

- Data protection solutions for enterprises including full disk, endpoint, desktop, mobile and email encryption

Wireless Security

- Enterprise mobility solutions to secure access to data, voice and video across wireless networks

VMware/Virtual Client Solutions

- Cohesive, multi-layered security protection of virtualized machine resources

Identity and Access Management

- Solutions to strengthen and automate user access rights, privileges and authentication as well as security event management

Managed Security Services

- Managed and Monitored Firewall Service
- Managed Intrusion Detection/Prevention
- Managed Vulnerability Service
- Managed Protection Services
- Managed Security & Event Log Management

Professional Security Services

- Information Security Assessments
- Penetration Testing
- Regulatory Compliance Assessments (PCI, SOX, GLBA, etc.)
- Emergency Response & Forensic Investigation
- Application Security Assessments
